<b>Specificity</b>	<p><b>Rabbit anti yeast Rad9 antibody</b> detects <i>Saccharomyces cerevisiae</i> Rad9, a protein involved in the DNA damage checkpoint. In <i>S. cerevisiae</i> this checkpoint is mainly controlled by the PI(3) kinase-like kinase (PIKK) Mec1, which is activated in response to DNA damage. Activated Mec1 hyperphosphorylates Rad9, which in turn triggers the binding of Rad53, the orthologue of mammalian Chk2. Activated Rad53 specifically targets substrates required for cell cycle arrest, gene expression and efficient DNA repair. Mutations affecting Rad9 impair checkpoint induced cell-cycle arrest and increase genomic instability.</p> <p>Rabbit anti yeast Rad9 antibody (<b>AHP1294</b>) is reactive with both the phosphorylated and non-phosphorylated forms of this protein.</p>
<b>Western Blotting</b>	AHP1294 detects a band of approximately 60kDa.
